

C L A I M S

What is claimed and desired to be secured by Letters Patent
is as follows:

Sub 7

1. A threadform {for a first medical implant
threadedly receivable in a second medical implant
wherein the first implant has a direction of
advancement along an axis of rotation relative to
the second implant;} said threadform comprising:
 - a) a leading surface that has an inner edge and
an outer edge;
 - b) a trailing surface that has an inner edge and
an outer edge; and wherein
 - c) intersections of a plane passing through said
axis of rotation with both said leading
surface and said trailing surface slope
rearwardly relative to the direction of
advancement from the respective inner edges
to the outer edges thereof.
2. The threadform according to Claim 1 wherein:
 - a) the intersection of said trailing surface

with a plane passing through said axis of rotation is at a first angle of from about 1° to about 45° relative to a line perpendicular to said axis of rotation.

3. The threadform according to Claim 2 wherein:
 - a) said first angle is between about 5° and 20° .
4. The threadform according to Claim 2 wherein:
 - a) said first angle is between about 7° and 15° .
5. The threadform according to claim 2 wherein:
 - a) the intersection of said leading surface with a plane passing through said axis of rotation is at a second angle of from about 30° to about 75° relative to a line perpendicular to said axis of rotation.
6. The threadform according to Claim 2 wherein:
 - a) said second angle is in the range from 40° to 50° .

7. The threadform according to Claim 1 wherein:
 - a) said trailing and leading surfaces are nonparallel.
8. The threadform according to Claim 1 in combination with the first implant wherein said first implant has a cylindrical shaped body about which said threadform is positioned.
9. The combination according to Claim 8 wherein:
 - a) said threadform is helically wound about said cylindrical shaped body.
10. The combination according to Claim 9 wherein:
 - a) said threadform is continuous.

11. The combination according to Claim 1 wherein:

a) said threadform is in a helical pattern, but is discontinuous.

- implant in closing said first implant; and
- c) each of said arms include a threadform on inner facing surfaces thereof sized and shaped to matingly and threadedly receive the thread of said closure implant.

14. The device of Claim 13 wherein:

- a) the inner and outer edges of both said leading surface and said trailing surfaces are each spaced from the axis of rotation at substantially the same radius over substantially the entire length of the thread.

15. The device of Claim 13 wherein:

- a) said inner edges of both said leading and trailing surfaces are substantially spaced and said outer edges of both said leading and trailing surfaces are in close proximity to each other throughout the length of the thread such that the thread is generally triangular in cross-section.

Pub 10

- e device according to Claim 15 wherein:
said cross-section has the general shape
an obtuse triangle.
- a thread having an axis of rotation with a
leading surface and a trailing surface relative to
advancement along the axis of rotation; the
improvement comprising:
- said trailing surface having an inner and
outer edge; said trailing surface sloping
rearwardly from the inner edge to the outer
edge thereof; and said inner edge having
generally constant radius over an entire
length of said thread.
- a medical implant having a cylindrical shaft
outer surface with a thread wound in a helical
pattern about said outer surface and wherein
said thread has a leading surface and a trailing
surface relative to advancement of the implant
along an axis of rotation; the improvement
comprising:
- said trailing surface having an inner and

Sub 201

outer edge; any intersection of said trailing surface with a plane passing through the axis of rotation slopes rearwardly from an inner radius to an outer radius of said trailing surface over substantially the entire length of said trailing surface.

19. In a thread having a leading surface and a trailing surface relative to advancement about an axis of rotation; the improvement comprising:
- a) both said leading and trailing surfaces having respective inner and outer edges; said trailing surface sloping rearwardly from the inner edge to the outer edge thereof; said trailing surface and leading surface inner edges being spaced and said trailing surface and leading surface outer edges being in close proximity to one another, such that said thread is generally triangular in cross-section.
20. The implant according to Claim 19 wherein:
- a) said cross-section is generally in the shape

of an obtuse triangle.

21. In a medical implant having a cylindrical shaped outer surface with a thread helically wound about said outer surface and wherein said thread has a leading surface and a trailing surface relative to advancement of the implant along an axis of rotation and further wherein both said trailing surface and said leading surface have respective inner and outer edges; the improvement comprising:
- a) said leading and trailing surfaces both sloping rearwardly from respective inner to outer edges thereof; said trailing surface and leading surface inner edges being spaced and said trailing surface and leading surface outer edges being in close proximity to each other over substantially the entire length of the thread such that the thread has a substantially triangular shaped cross section.
22. In a thread having a leading surface and a trailing surface relative to advancement about an

axis of rotation; the improvement comprising
wherein:

- a) both of the intersections of said leading surface and said trailing surface with a plane passing through the axis of rotation slope rearwardly from a radially inner edge to outer edge thereof; and
 - b) a first angle between the leading surface intersection and a line perpendicular to the axis of rotation is substantially greater than a second angle between the trailing surface intersection and a line perpendicular to the axis of rotation.
23. The thread according to Claim 22 wherein:
- a) said second angle is between about 1° and 45°.
24. The thread according to Claim 23 wherein:
- a) said first angle is greater than 30°.
25. The thread according to Claim 22 wherein:
- a) said first angle is in the range from about 30° to 45° and said second angle is in the
